ThemeBot

Your website, turned into a real Shopify store — automatically.

> **In one sentence:** you give ThemeBot a website and a store name. It creates the Shopify store, connects to it, rebuilds the website as a proper Shopify theme, then checks and fixes its own work until the two match.

1 Tell it about the store
Store name, website link, and/or the website's files.

2 Confirm the website
ThemeBot shows you a picture of the site. You say "yes, that's the one".

3 Sign in once
One Shopify sign-in. Nothing starts before that.

4 ThemeBot sets up the store
Creates the store (no card), connects to it, runs a test edit.

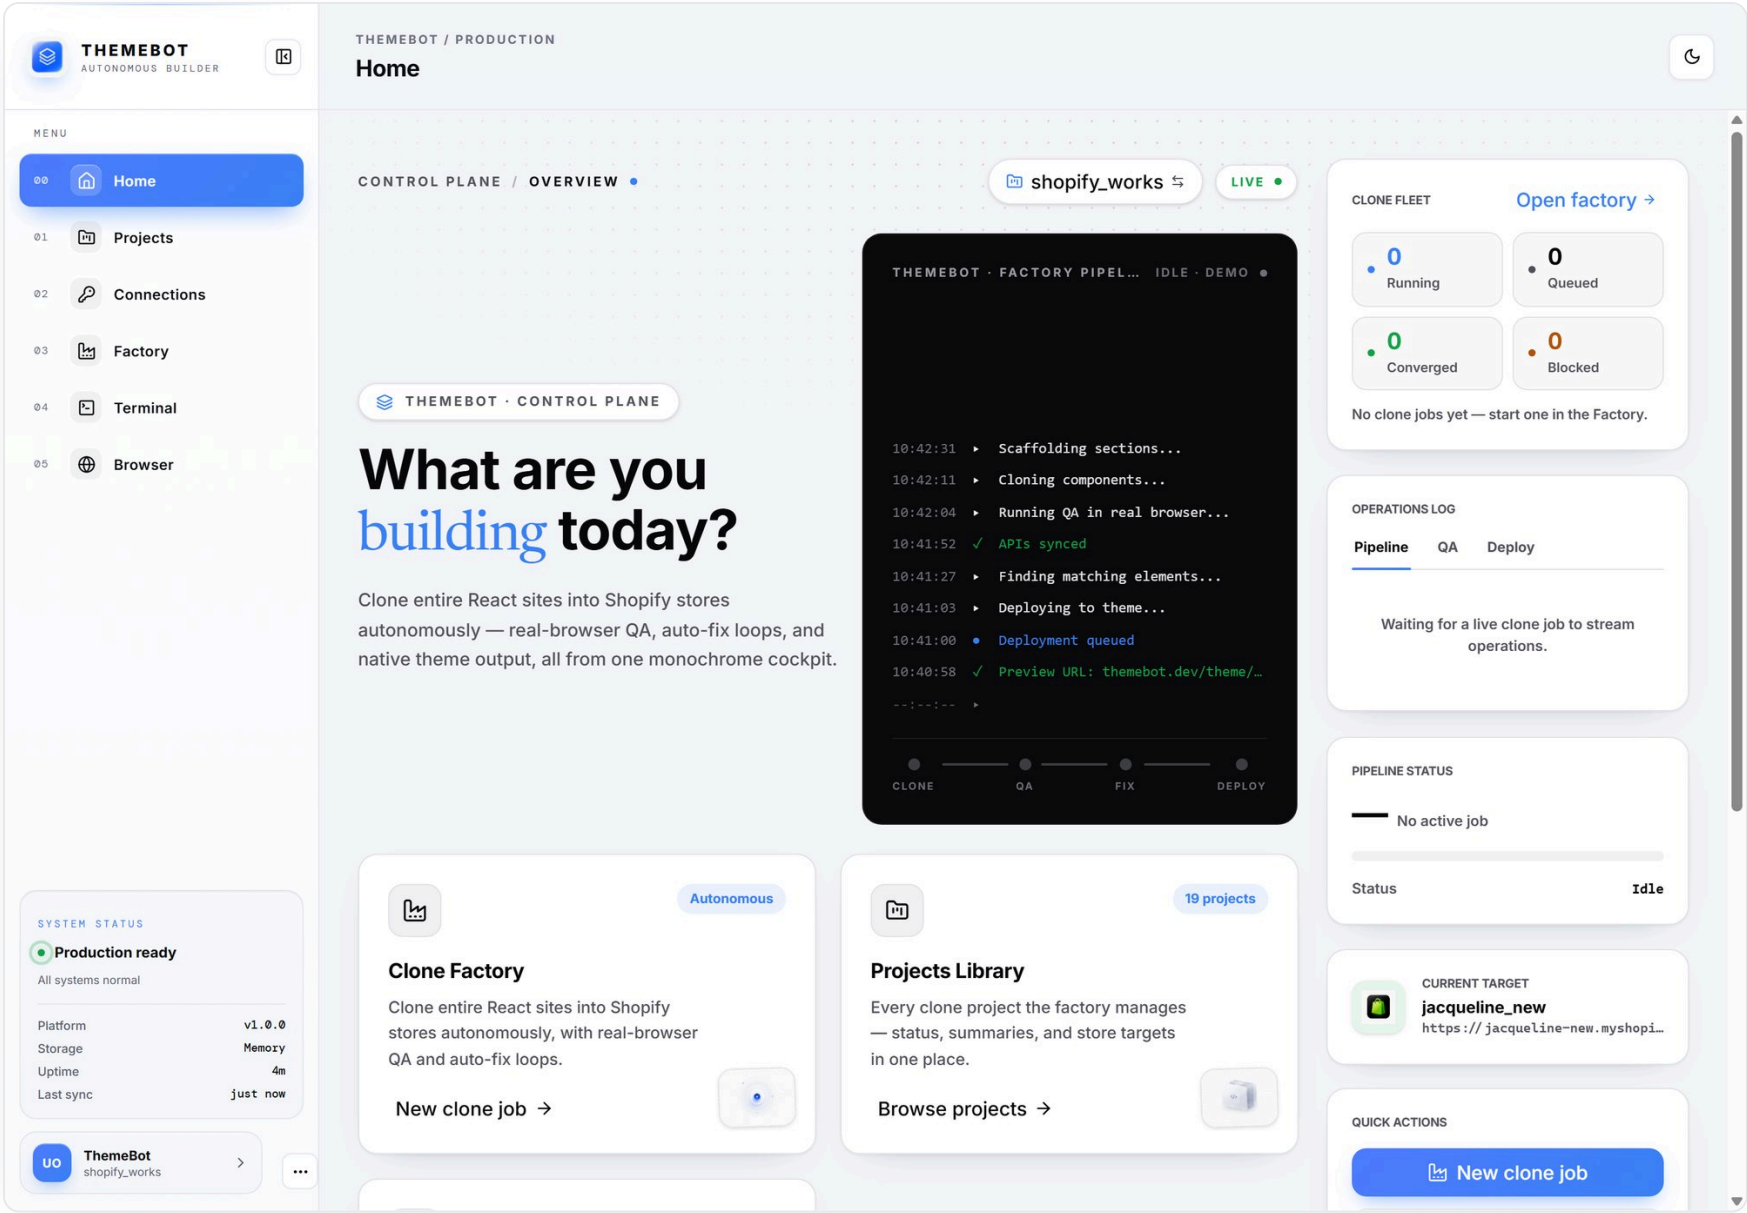

5 Build, check, fix
Rebuilds the site as a theme, compares, fixes, reports.

Progress report · 14 September 2026 · Every picture in this document is a real screen from the working app.

1 The control room

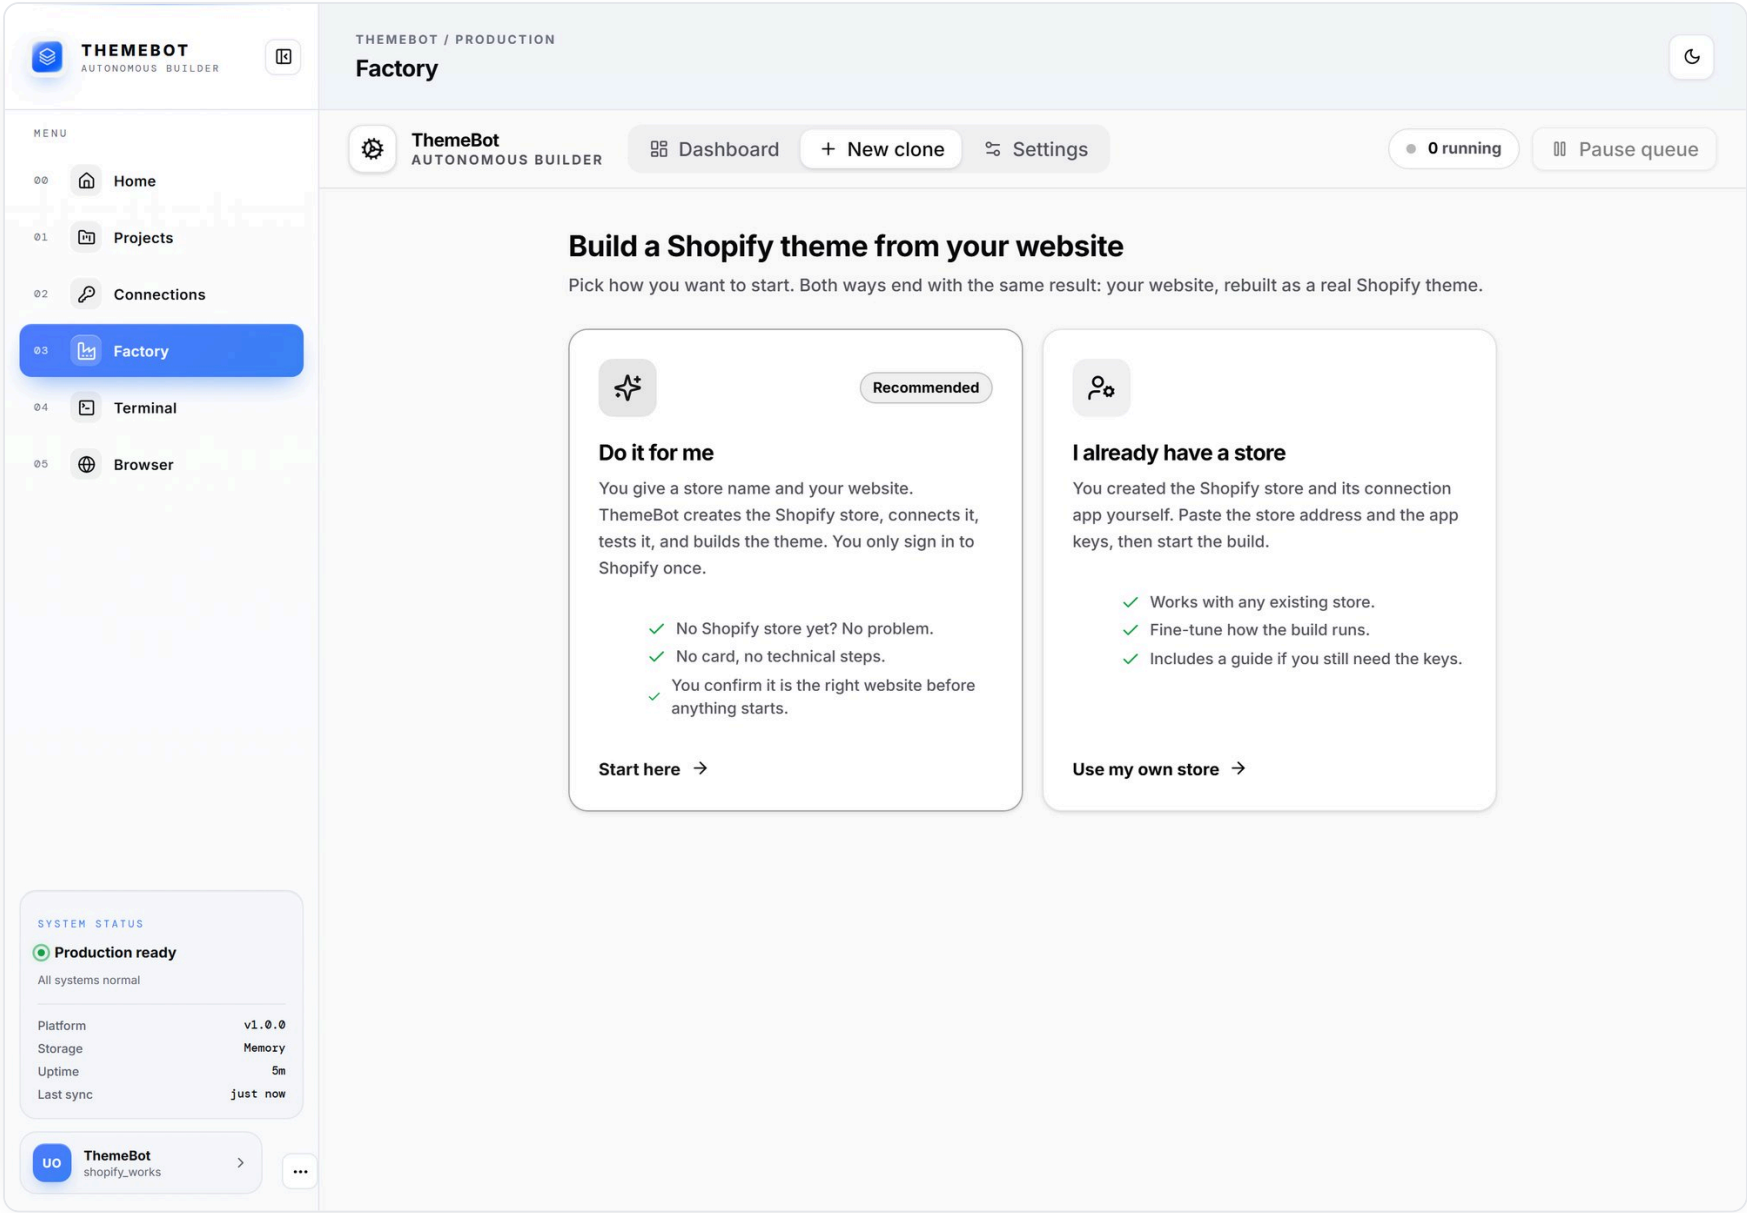

HOME SCREEN

One place to **start a build**, see every project, follow progress, and watch ThemeBot work in its built-in browser.

2 Choose how to start

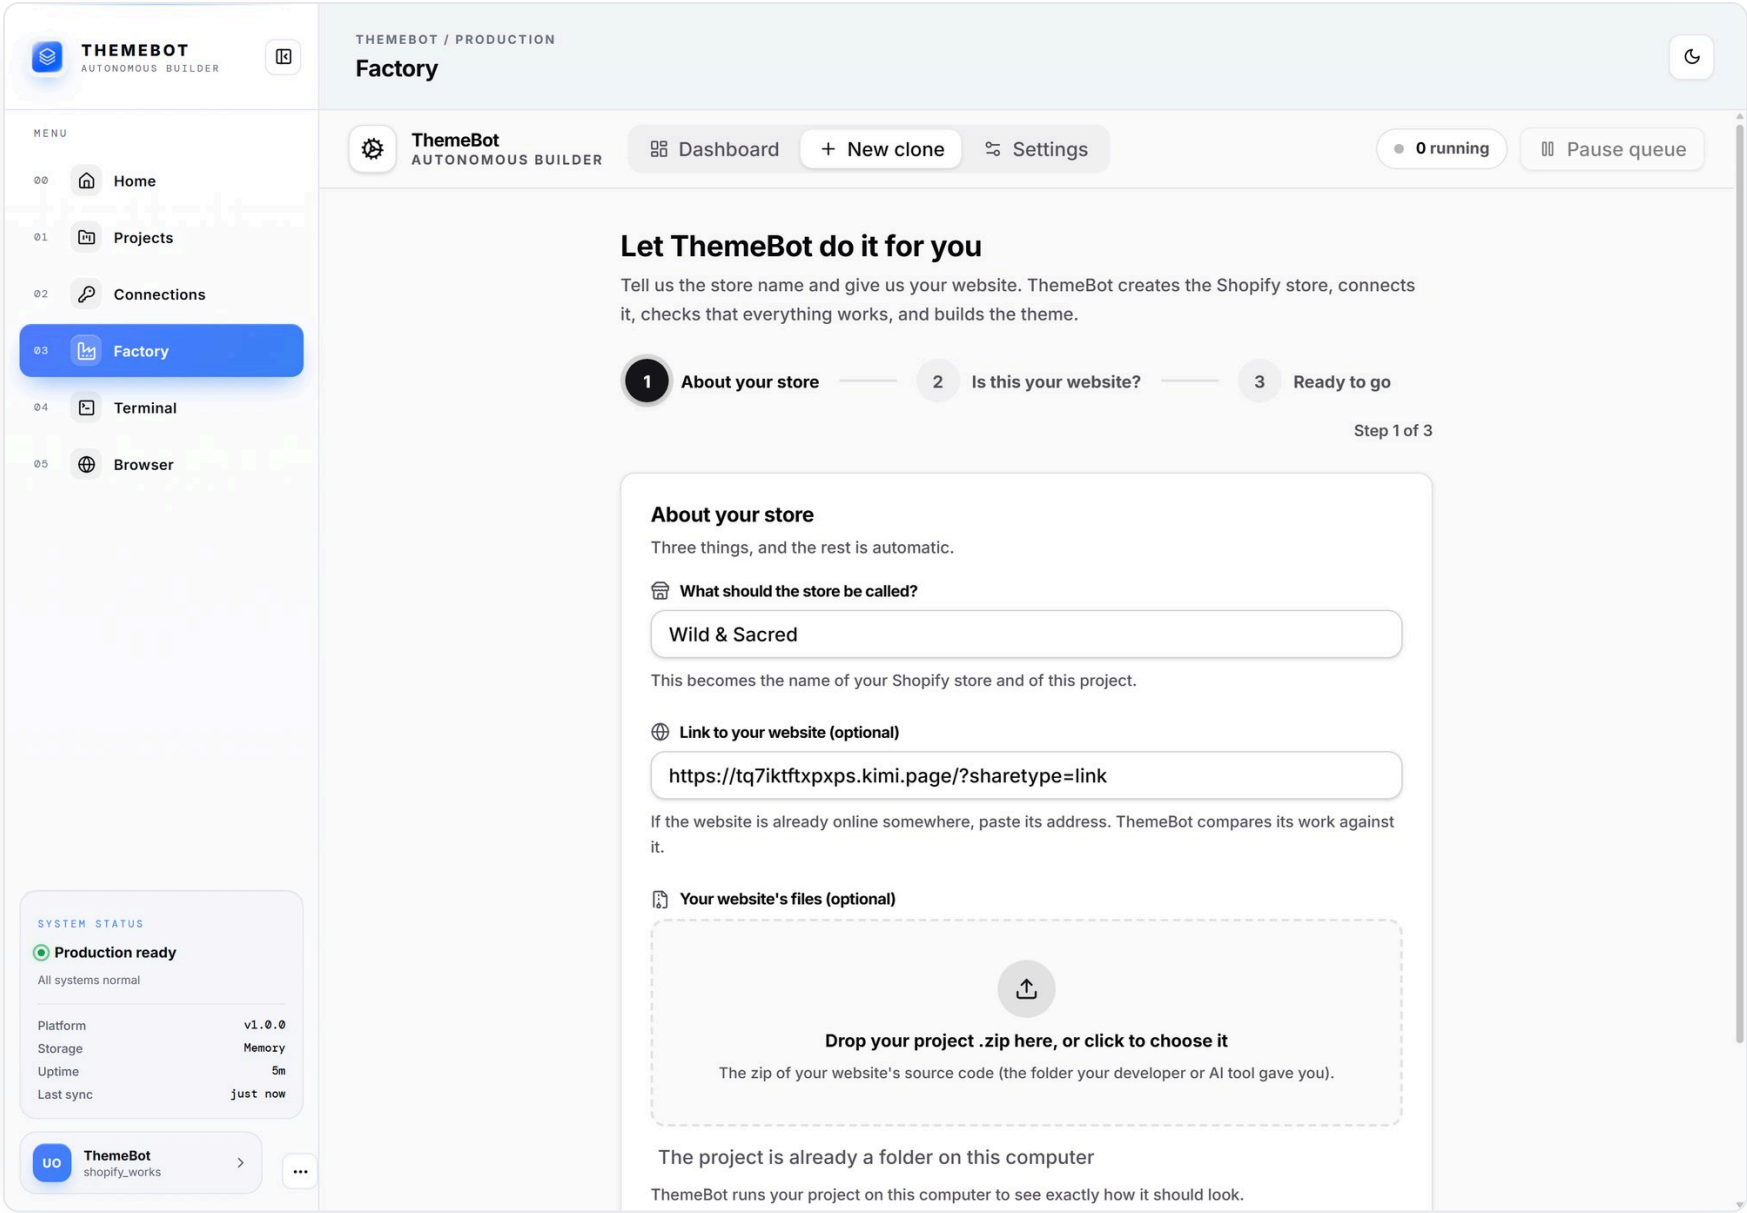

"Do it for me" if there is no Shopify store yet. **"I already have a store"** if one was set up by hand. Same result either way.

3 Tell it about the store

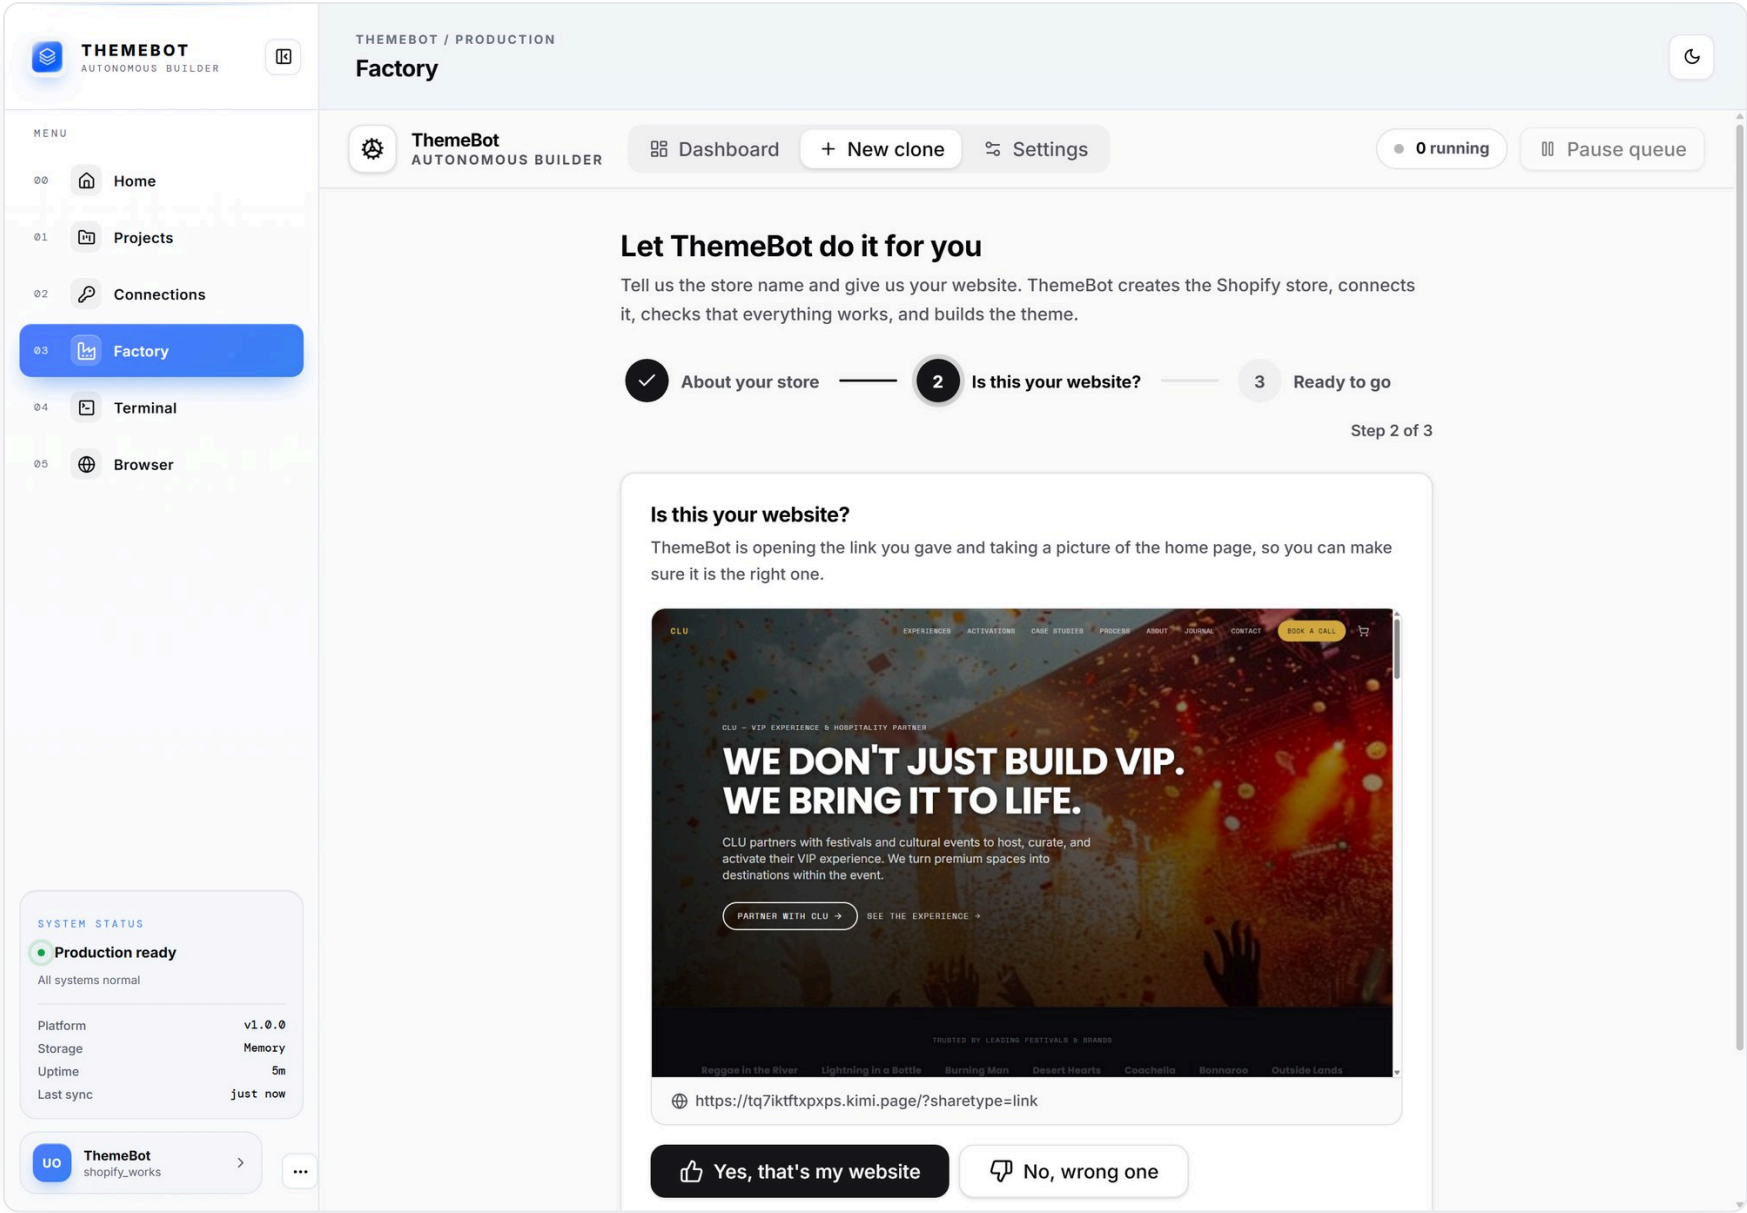

STEP 1 OF 3

A **name**, an optional **link**, and a drop zone for the website's files. Three things, then it is automatic.

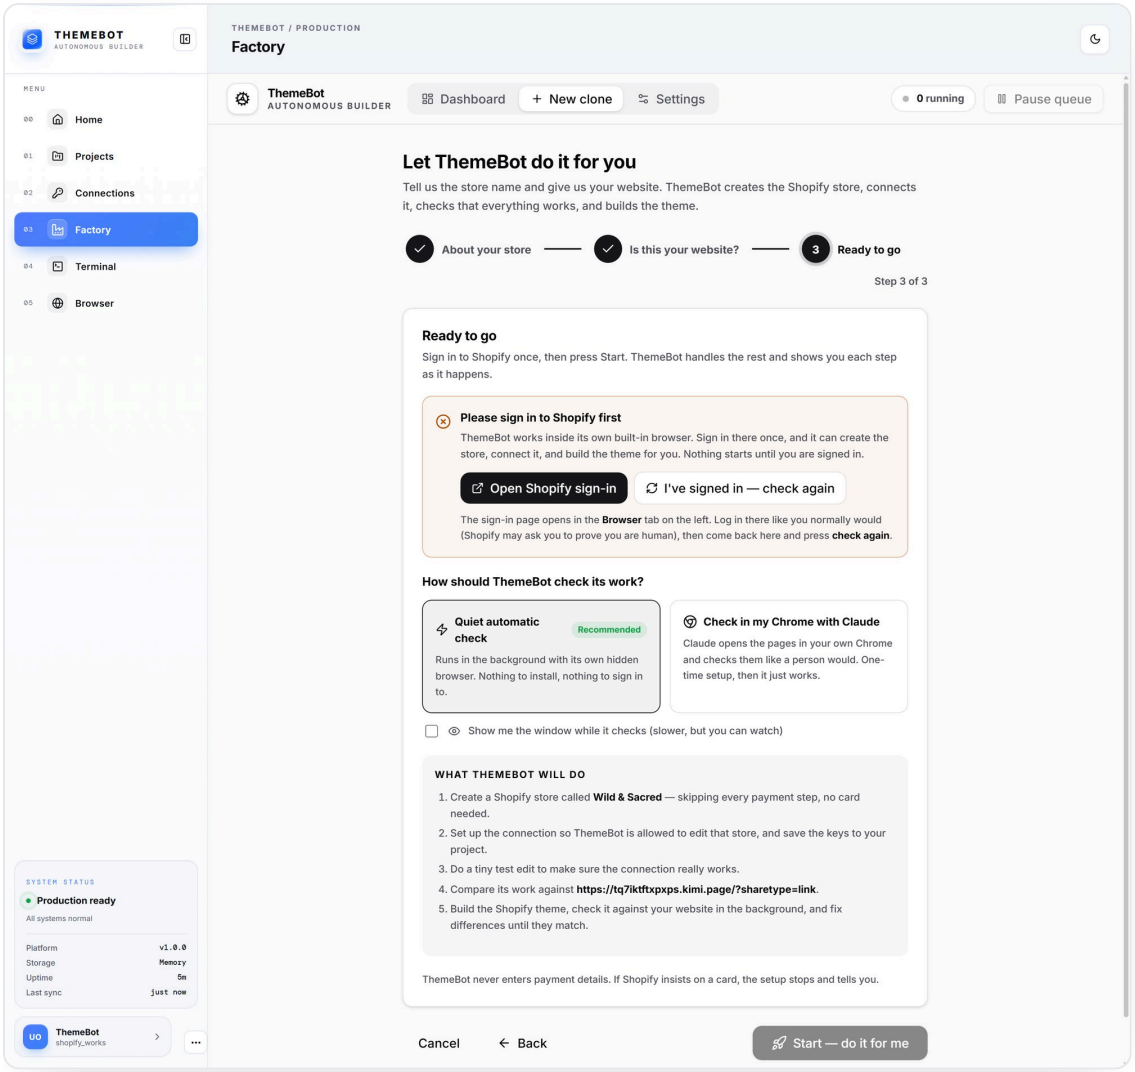

4 "Is this your website?"

ThemeBot opens the site (or runs the uploaded files) and shows a **picture of the home page** before anything is created. One click to confirm.

5 Ready to go

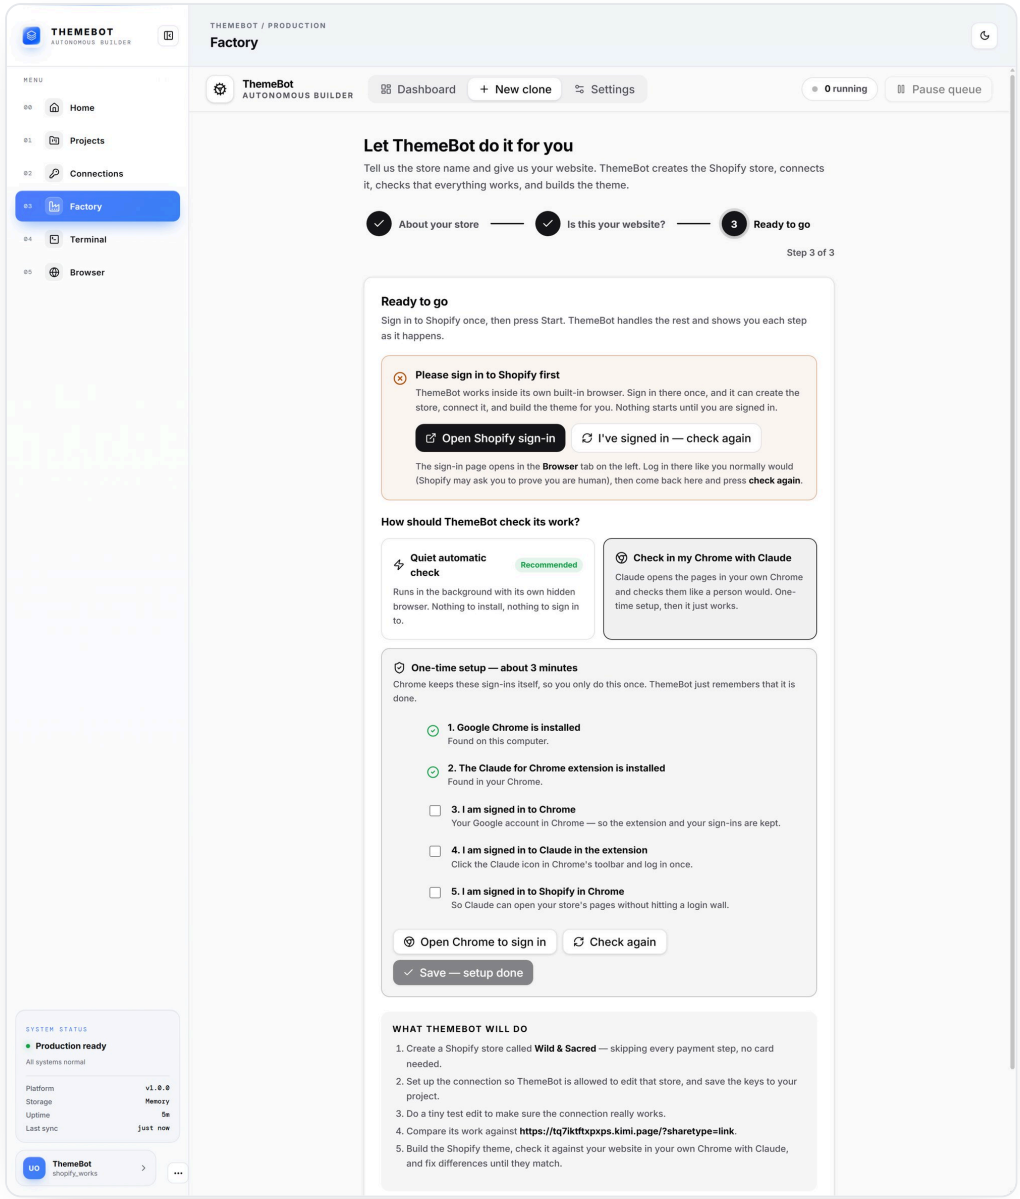

Sign in once, then press Start

- **The sign-in check.** ThemeBot looks at whether its browser is signed in to Shopify. If not, it opens the sign-in page and waits. The Start button stays locked until you are in.
- **How it checks its work.** A quiet automatic check in the background (recommended), or a check inside your own Chrome with Claude.
- **What will happen.** A plain list of every step ThemeBot is about to take, written for the person pressing the button.

> ThemeBot never enters payment details. If Shopify insists on a card, the setup stops and says so.

6 Optional: check in your own Chrome

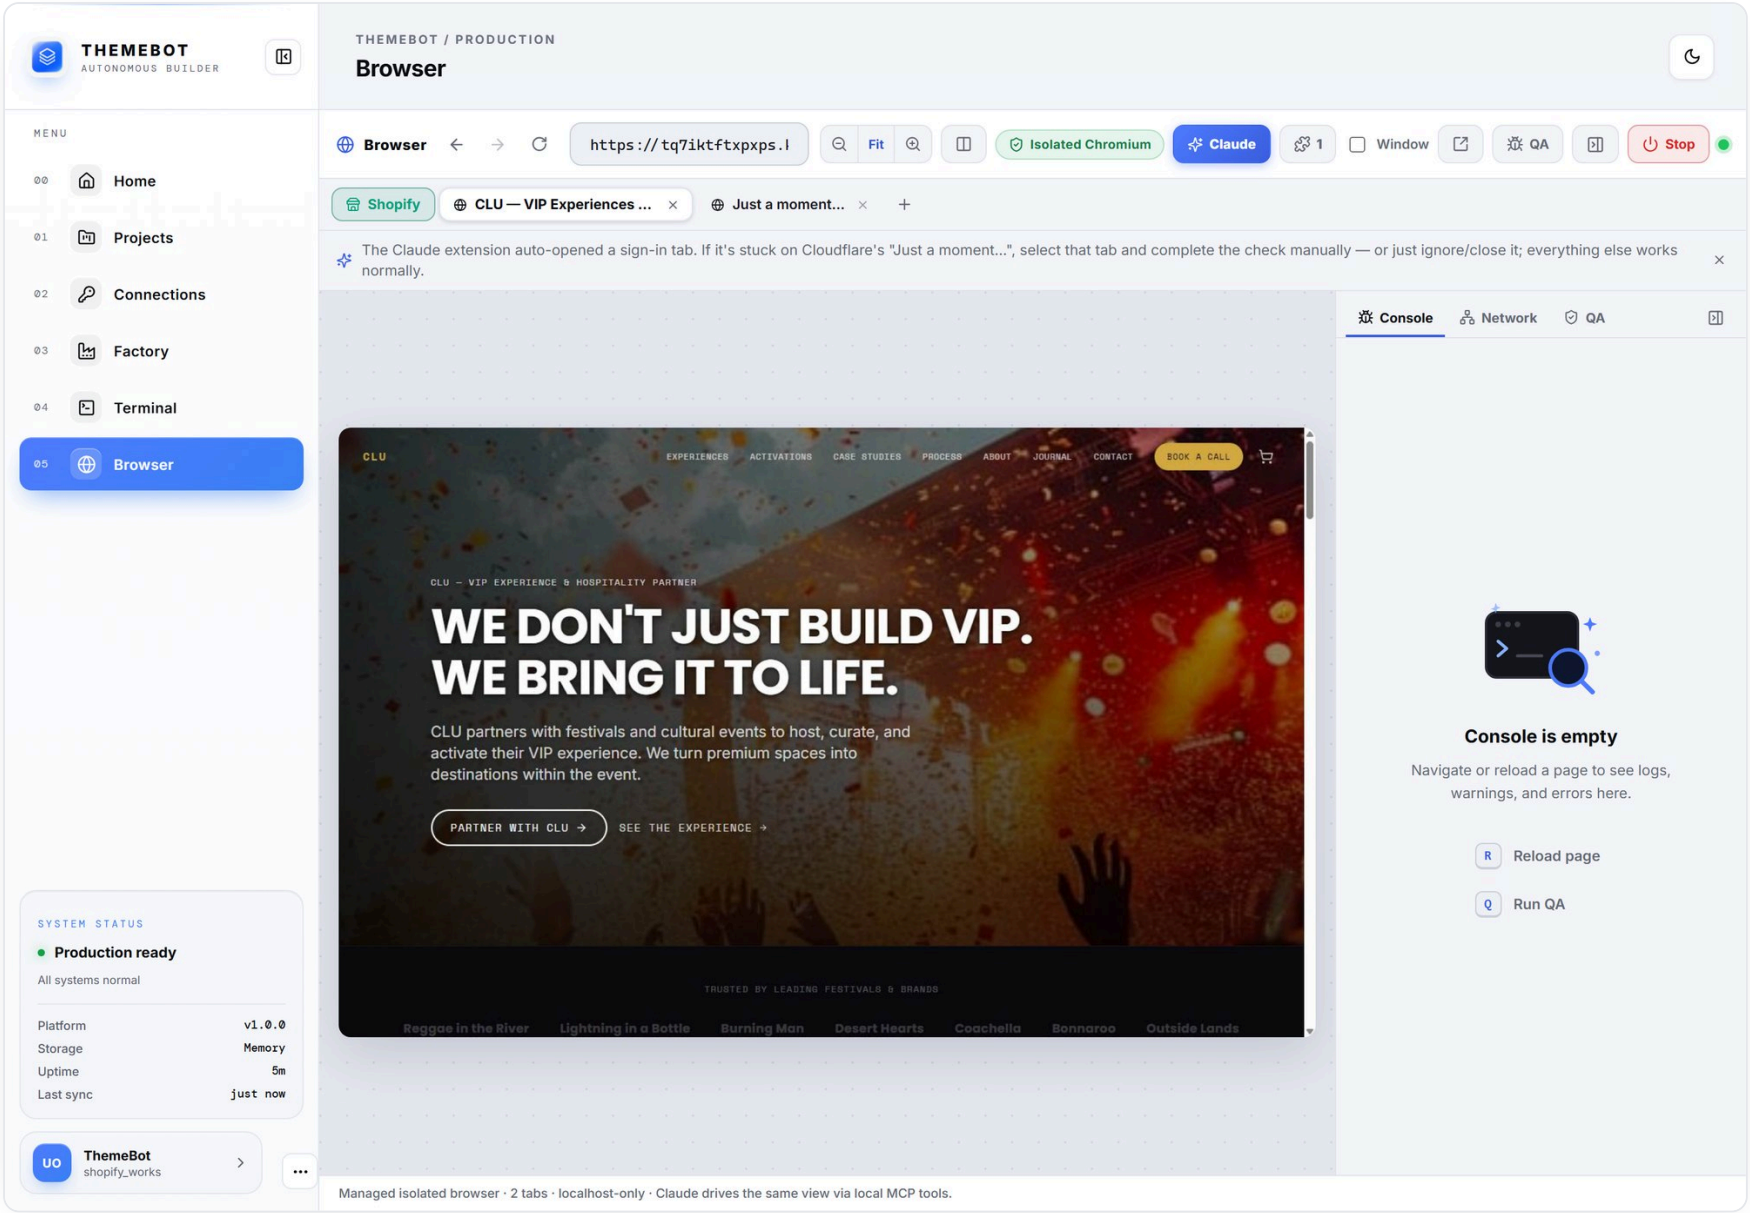

Three minutes, done once, remembered forever

- Chrome and the Claude extension are **detected automatically** (the green ticks).
- The three sign-ins are confirmed by you, once. Chrome keeps them; ThemeBot only remembers that the setup is complete.
- Prefer not to bother? Pick the quiet automatic check instead and skip this entirely.

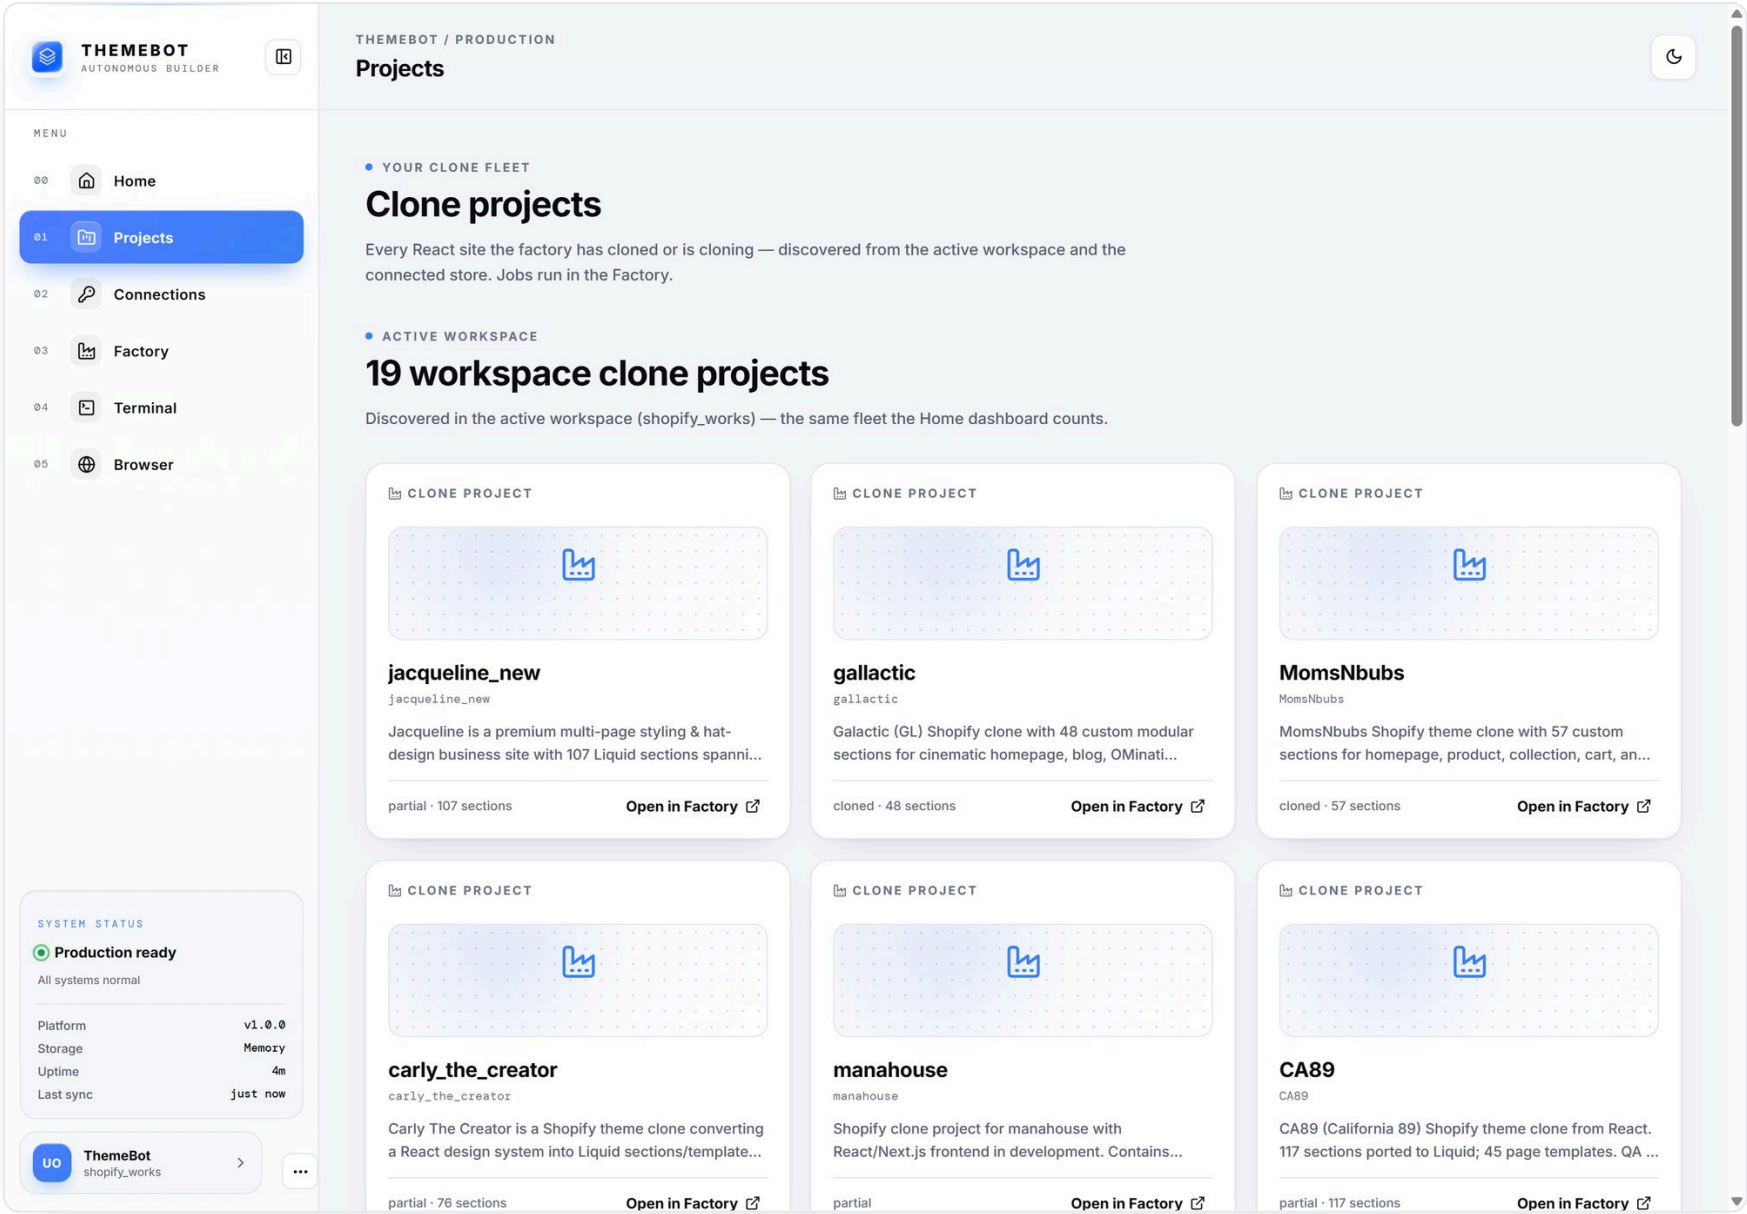

7 Watch it work

ThemeBot has its **own browser inside the app**. This is it, live on the website being rebuilt — the same window where the store gets created and checked.

8 Every project in one list

Each build is a card: which website, which store, how far along. **19 projects** from earlier work are already in the library.

9 Where we are

14 SEPTEMBER 2026

PIECE	STATUS
Control room & project list	Done
Guided "do it for me" flow (the three screens)	Done
Website preview & confirmation	Done & tested
Shopify sign-in check	Done & tested
Store connection, keys, test edit	Done
Automatic store creation (no card)	Built — first live run pending
Build → check → fix loop	Done
Quality-check options (quiet / own Chrome)	Done
Route for people who already have a store	Done
End-of-build result report with before/after pictures	Next
Public release: name, pricing, hosting, Shopify listing	Next

What happens next

- **First full live run.** Create a real store from scratch through "do it for me", end to end, and record it.
- **Result report.** When a build finishes, ThemeBot hands over a one-page summary with before/after pictures.
- **Release decisions.** Final name, pricing, and hosting.

> A live walkthrough takes about ten minutes: pick "Do it for me", drop in a website, confirm the picture, sign in once, and watch the steps tick through on screen.
